

Restaurant Prices in Hamburg's Tourist Hotspots: A Chi-Square Analysis

Research Question

Are restaurant prices higher near tourist attractions?

Google Maps API

restaurants and tourist attractions in Hamburg

Results

Chi²-Value: 8.511

p = 0.0366

Degrees of Freedom: 3

Price Level	With Attractions	Without Attractions
Inexpensive	213	16
Moderate	803	31
Expensive	57	0
Very Expensive	22	0

Methodology

Data analyzed with **Chi-Square Test** to examine the relationship between **location** (hotspot vs. non-hotspot) and **price level** (inexpensive to very expensive)

Interpretation

Significant Relationship:

p = 0.0366 < 0.05

Chi²-Value: 8.511 > 7.81

p-Value: p < α = 0.05

❗ Conclusion: The null hypothesis rejected

Interpretation

❗ Significant Relationship:

p = 0.0366 < 0.05

▶ Chi²-Value: 8.511 > 7.81

p-Value: p < α = 0.05

Expected Frequencies under H₀

	With Attractions	Without Attractions
Inexpensive	219.53	9.42
Moderate	799.68	34.32
Expensive	54.55	2.35
Very Expensive	21.09	0.91

Cramér's V: 0.086 (Small Effect Size)

- **Important:** The test does not state that attractions cause higher prices.
- It only says: The price structure is different.
